MYPET
MICROCHIP DATABASE

How microchipping works?

1. A microchip contains a unique 15 digit number. This 15 digit number is then linked to your details via a Defra compliant microchip database.

2. Your vet / microchip implanter will either register your details against the microchip or give you details on how to do this.

3. If your vet / implanter registers your pet for you, the microchip database should get in touch with you. If you register yourself you should get confirmation emailed to you.

4. The database should also have a 24/7 phone number incase someone doesn't have database access.

5. If your pet ever goes missing and their microchip is scanned vets, dog wardens, police and animal rescues have access to these databases.

1. A microchip is not a tracker. It can't track your pet.

2. If you move house or change your number update your details with the database.
